1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-3 are rejected under 35 U.S.C. 103(a) as being unpatentable over JP 8-85328 in view of JP2001-277833 both cited by applicant .

JP 8-85328 discloses stabilizer control apparatus comprising stabilizer including pair of stabilizer bars between a right wheel and left wheel of vehicle and actuator having motor and speed reducing mechanism for transmitting power of motor with normal and reverse efficiency, control means for controlling motor in response to turning state of vehicle to control torsion rigidity and wherein control means control motor in response to detected result of position detection means, see abstract. JP 8-85328 lacks disclosing rotation angle sensor. JP 2001 -277833 disclose angle sensor, see paragraph 16 and 30 and abstract. It would have been obvious to one of ordinary skill in the art to combine the stabilizer control of JP 8-85328 with angle sensor of JP 2001-277833 for improved control.
